

Herald

Catalogue-Check — HRD-099 commons_auth/

Renumbered 2026-05-21: Originally tracked as HRD-093 during Wave 3a design + implementation; renumbered to HRD-099 in the post-Wave-3a doc-cleanup pass to resolve a collision with Wave 2's HRD-093 (sherald flavor scaffold, commit 6145cec). All Wave 3a commits (dbbea95 . . 0cc6fad) still reference HRD-093 in their messages — that's the executing-time history; HRD-099 is the canonical anchor going forward.

Field	Value
Date	2026-05-21
Target	commons_auth/ (JWT verifier + Gin middleware)
Orgs queried	vasic-digital/* , HelixDevelopment/*
Verdict	no-match → vendor as Herald-internal package
Evidence commits Wave 3a task 1 (commit dbbea95)	

Search performed

1. `gh search repos --owner=vasic-digital --owner=HelixDevelopment 'jwt jwks gin' --limit 30` → 0 hits with JWT+JWKS+Gin middleware shape.
2. Reviewed `digital.vasic.auth` (submodules/auth/pkg/jwt/jwt.go) — provides a single-secret HS-only Manager with Create/Validate/Refresh methods. NOT a JWT verification middleware. No JWKS, no Redis cache, no Gin handler, no rotation-race re-fetch.

Verdict rationale

No existing module in our orgs provides the exact triple Herald needs:

- HS256 AND RS256/ES256 verification in a single `Verifier` interface
- JWKS HTTPS fetch with Redis cache + in-memory fallback + rotation-race re-fetch
- Gin middleware factory that stores claims into request context under a documented key

`digital.vasic.auth/pkg/jwt` covers ~30% of (1) only; (2) and (3) are unimplemented. Forking + extending would mix Herald-specific opinions (Redis cache key prefix `herald:auth:jwks:`, claim-shape `tenant+sub`) into a project-neutral submodule — which CONST-051(B) forbids. Vending as Herald-internal `commons_auth/` is the correct choice.

When the Herald project later identifies primitives general enough to lift back, we can promote them upstream per §11.4.35 with an explicit `Lifted from herald to digital.vasic.auth` per §11.4.35 commit annotation.

Public surface
