

Herald

Herald — Microsoft Teams Channel Setup Guide

Field	Value
Status	PLANNED — HRD-NNN (planned V3)
Spec ref	V3 §11 (later iteration)
Env vars (reserved)	HERALD_TEAMS_WEBHOOK_URL OR HERALD_TEAMS_BOT_APP_ID + HERALD_TEAMS_BOT_APP_PASSWORD
Code	(not yet implemented)

Microsoft Teams is reserved for V3. Two integration paths: (a) Incoming Webhook (simplest — connector URL only; one-way fan-out only), or (b) Bot Framework registration (full two-way, requires Azure AD app).

This guide is a **placeholder**. When the Microsoft Teams adapter lands as an HRD, this file will expand to the same step-by-step structure as [TELEGRAM.md](#): obtain credentials → set env vars → verify HealthCheck → verify Send → optional Subscribe → troubleshooting.

What you can do now

- Reserve the env-var names in your `.env` (commented out, per [../OPERATOR_CREDENTIALS.md](#)).
- Watch the HRD for status updates — it will move from `open` to `code complete`; `awaiting live evidence` to `Fixed` over its implementation lifecycle.
- If you have an urgent need for the Microsoft Teams channel, open an issue against the HRD asking for priority — operator-driven escalation is honored per the constitution.

Related
